

MENTAL TELEPATHY IS REAL!

The concept of mental telepathy is the process of being able to transfer thoughts from one mind onto another. This has been traditionally created in the other realms of either the Science Fiction or the paranormal. Both realms exist just outside the concept of mainstream science.

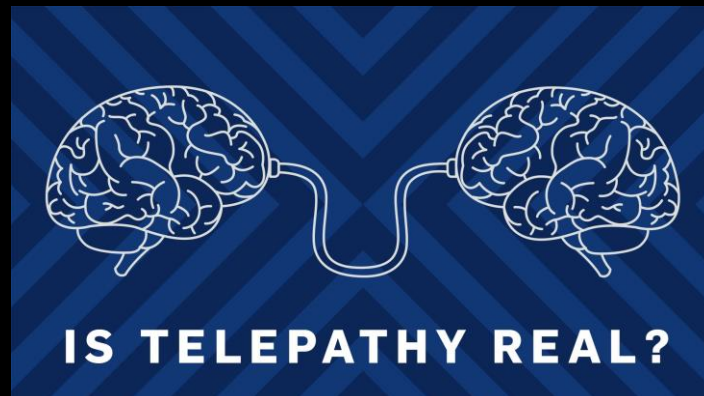

However, in 2014, researchers have altered that concept and have provided a scientific validation in order to properly demonstrate the long feat of mind-to-mind communication.

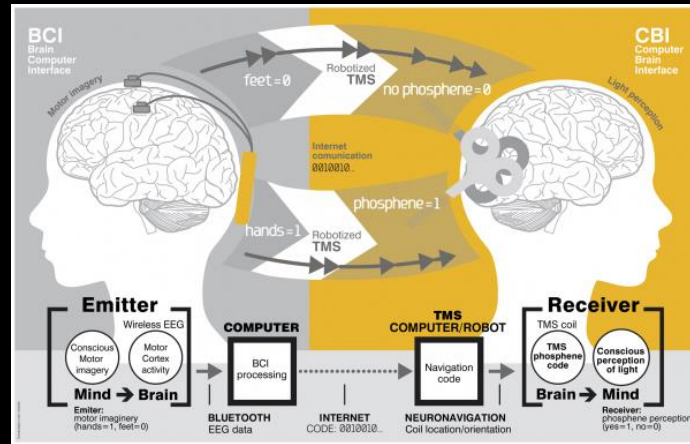

A neuroscientist, Carols Grau, from the University of Barcelona and his colleagues have setup a very clever experiment in which they are able to pick up signals from a device known as

Electroencephalograph EEG from the selected test subjects in India were able to be transmitted over the internet by means of email messages onto other subjects that are located in France. The subjects in France had their scalps properly fitted with the Trans Cranial Magnetic (TMS) simulators in order to receive the signal. Those TMS devices, that has also been previously utilized in order to treat those with anxiety and even depression, is able to electrically stimulate the respective neural activity inside of the brain in which are then connected to the intact scalps that are using a strong magnetic fields. During the course of this experiment, the TMS stimulators where then placed

over the test subject's occipital (the visual aspect) cortex that is located at the back of the brain. Then creating a perceived flash of light that the researchers call phosphine, that is able to travel through the neural activations upon the visual cortex.

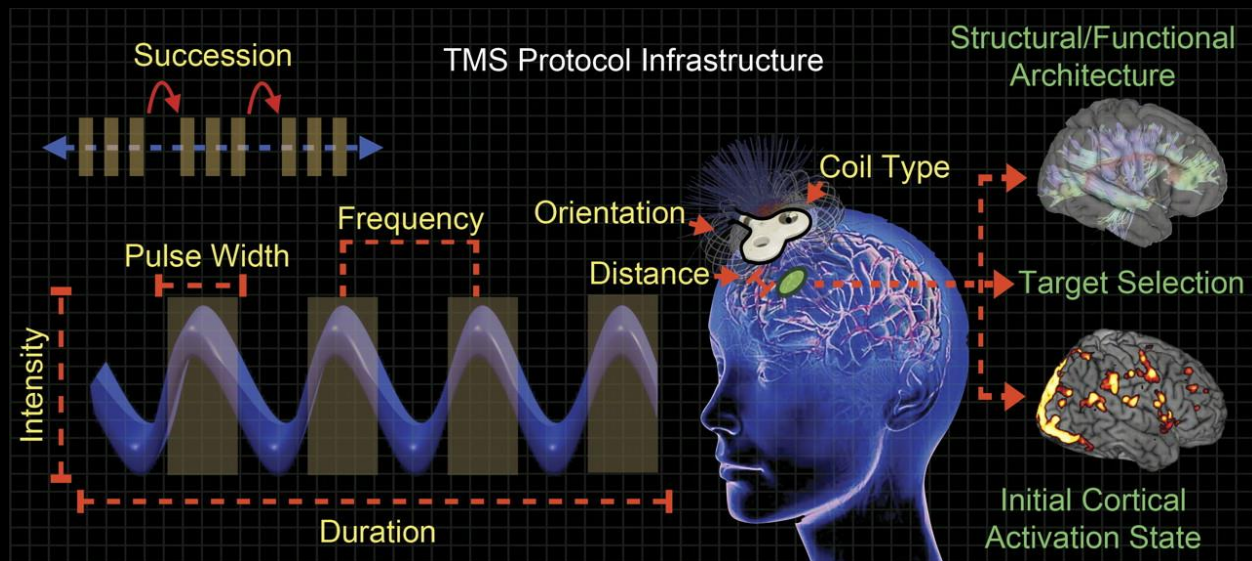

Those of the test subjects located in India, have been properly trained onto generating a specific EEG signal in which represents that of a 1 (one) or a 0 (zero) while using the biofeedback monitor. The 1 (one) would be generated if the test subjects had imagined moving a hand, and the 0 (zero) was produced when the test subjects had imagined moving a foot. Then the 1's (ones) and 0's (zeros), were sent through the massive online internet by utilizing an email client that traveled from India onto France. It would then be routed into one of two different TMS devices that was placed upon the other subject's head. The 1 (one) would be routed onto a TMS electrode in which caused a chain reaction to a phosphene in order to be perceived. On the other hand, the 0 (zero) would be routed onto a different TMS device in which would then proceed onto activating the produced no phosphenes.

The figure above provides an illustration upon how the mind-to-mind can communicate with each other upon a working path.

The best way to explain this concept is to imagine this type of neurological Morse code. The researchers of the project have developed and even encoded a series of 1 (ones) and 0 (zeros) that then can be altered into native words such as “Hola” and even “Ciao”. This then provides us with a simple linguistic communication was in fact plausible.

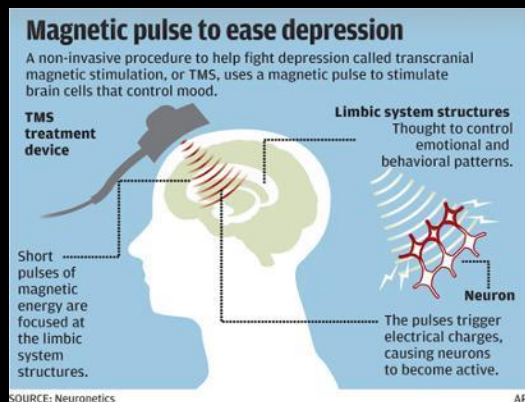

Moreover, the bottom line is that the researchers conducting the experiment has more or less actually worked. There are error rates of the transmitting of the 1 (ones) and 0 (zeros) had varied from 1-Percent to 11-Percent. Which is in fact well below that the researchers had expected. This is a result from random noises between the connections.

What is the big concern about this project?
 This experiment is starting to provide some insight
 information upon the biggest break troughs of
 telepathy connectivity. This has also demonstrated
 that it is just as much of a historic breakthrough
 like we have seen with Alexander Graham Bell in
 which once stated;

“Watson, come here, I want to see you”
 That was the very first voice communication over a
 telephone.

In the Grau et al’s experimentations, we might
 actually be looking at the dawn of a new
 revolutionary state of communication in which will
 one day completely transform our world as we have
 seen the telephone, television, and telegraph back
 when those technologies came out. We could easily
 be looking at a world of “Thinking” our message
 instead of texting or speaking for our basic means
 of communication. Which can assist us from having
 to type on those little keyboards built into
 phones, or vocal communication, thus allowing us to
 continue with the task at hand, like taking a
 shower.

However, my question is, if this becomes possible, what is to say that our next breakthrough (or even possibly a hack) that allows one to see events and images stored inside another mind without them even knowing?

If this mind-to-mind communication can eventually provide practicality, then it will be possible that we can then evolve into learning how to communicate subtle ideas and even nuances that text, speech, and even facial expressions will not be able to. This will revolutionize the way humans contact each other by having the ability to amplify and even enriching another depth of communication.
